Contents

1 Shortest Paths

1.1 Single-source shortest paths

1.1.1 Dijkstra

Dijkstra's algorithm with binary heap.

✘ Can't be performed on graphs with negative weights.

Usage:

`V`	Number of vertices.
`add_edge(e)`	Add edge e to the graph.
`dijkstra(src)`	Calculate SSSP from src.
`d[x]`	distance to x
`p[x]`	last edge to x in SSSP

Time complexity: $O(|E| \log |V|)$

```
const int INF = 0x7f7f7f7f;
const int MAXV = 10005;
const int MAXE = 500005;
struct edge{
    int u, v, w;
};

struct graph{
    int V;
    vector<edge> adj[MAXV];
    int d[MAXV];
    edge* p[MAXV];

    void add_edge(int u, int v, int w){
        edge e;
        e.u = u; e.v = v; e.w = w;
        adj[u].push_back(e);
    }

    bool done[MAXV];
    void dijkstra(int src){
        typedef pair<int,int> pii;
        priority_queue<pii, vector<pii>, greater<pii> > q;

        fill(d, d + V + 1, INF);
        d[src] = 0;
        fill(done, done + V + 1, false);
```

```
        q.push(make_pair(0, src));
        while (!q.empty()){
            int u = q.top().second; q.pop();
            if (done[u]) continue;
            done[u] = true;
            rep (i, adj[u].size()){
                edge e = adj[u][i];
                if (d[e.v] > d[u] + e.w){
                    d[e.v] = d[u] + e.w;
                    p[e.v] = &adj[u][i];
                    q.push(make_pair(d[e.v], e.v));
                }
            }
        }
    }
};
```

1.1.2 SPFA

Shortest path faster algorithm. (Improved version of Bellman-Ford algorithm)

This code is used to replace `void dijkstra(int src)`.

✓ Can be performed on graphs with negative weights.
⚠ For some specially constructed graphs, this algorithm is very slow.

Usage:

`spfa(src)`	Calculate SSSP from src.

Requirement:
1.1.1 Dijkstra

Time complexity: $O(k|E|)$, generally $k < 2$

```
    // ! This procedure is to replace `dijkstra', and cannot be used alone.
    bool inq[MAXV];
    void spfa(int src){
        queue<int> q;
        fill(d, d + V + 1, INF);
        d[src] = 0;
        fill(inq, inq + V + 1, false);
        q.push(src); inq[src] = true;
        while (!q.empty()){
            int u = q.front(); q.pop(); inq[u] = false;
            rep (i, adj[u].size()){
                edge e = adj[u][i];
                if (d[e.v] > d[u] + e.w){
```

```
                    d[e.v] = d[u] + e.w;
                    p[e.v] = &adj[u][i];
                    if (!inq[e.v])
                        q.push(e.v), inq[e.v] = true;
                }
            }
        }
    }
```

1.2 All-pairs shortest paths (Floyd-Warshall)

Floyd-Warshall algorithm.

✓ Can be performed on graphs with negative weights. To detect negative cycle, one can inspect the diagonal, and the presence of a negative number indicates that the corresponding vertex lies on some negative cycle.
⚠ **Self-loops** and **multiple edges** must be specially judged.
⚠ If the weights of edges might exceed `LLONG_MAX / 2`, the line `(*)` should be added.

Usage:

`init()`	Initialize the distances of the edges from 0 to V.
`floyd()`	Calculate APSP.
`d[i][j]`	distance from i to j

Time complexity: $O(|V|^3)$

```
const LL INF = LLONG_MAX / 2;
const int MAXV = 1005;
int V;
LL d[MAXV][MAXV];

void init(){
    Rep (i, V){
        Rep (j, V) d[i][j] = INF;
        d[i][i] = 0;
    }
}

void floyd(){
    Rep (k, V)
        Rep (i, V)
            Rep (j, V)
                // ! (*) if (d[i][k] < INF && d[k][j] < INF)
                d[i][j] = min(d[i][j], d[i][k] + d[k][j]);
}
```

2 Spanning Tree

2.1 Minimum spanning tree

2.1.1 Kruskal's algorithm

2.1.2 Prim's algorithm

3 Depth-first Search

3.1 Strongly connected components, condensation (Tarjan)

Find strongly connected components and compute the component graph.

⚠ The component graph may contain **multiple edges**.

Usage:

`V`	number of vertices
`scc[i]`	the SCC that i belongs to, numbered from 1.
`sccn`	number of SCCs
`find_scc()`	Find all SCCs.
`contract()`	Compute component graph.

Time complexity: $O(|V| + |E|)$

```
const int MAXV = 100005;

struct graph{
    vector<int> adj[MAXV];
    stack<int> s;
    int V; // number of vertices
    int pre[MAXV], lnk[MAXV], scc[MAXV];
    int time, sccn;

    void add_edge(int u, int v){
        adj[u].push_back(v);
    }

    void dfs(int u){
        pre[u] = lnk[u] = ++time;
        s.push(u);
        rep (i, adj[u].size()){
            int v = adj[u][i];
            if (!pre[v]){
```

```
20                  dfs(v);
21                  lnk[u] = min(lnk[u], lnk[v]);
22              } else if (!scc[v]){
23                  lnk[u] = min(lnk[u], pre[v]);
24              }
25          }
26          if (lnk[u] == pre[u]){
27              sccn++;
28              int x;
29              do {
30                  x = s.top(); s.pop();
31                  scc[x] = sccn;
32              } while (x != u);
33          }
34      }
35
36      void find_scc(){
37          time = sccn = 0;
38          memset(scc, 0, sizeof(scc));
39          memset(pre, 0, sizeof(pre));
40          Rep (i, V){
41              if (!pre[i]) dfs(i);
42          }
43      }
44
45      vector<int> adjc[MAXV];
46      void contract(){
47          Rep (i, V)
48              rep (j, adj[i].size()){
49                  if (scc[i] != scc[adj[i][j]])
50                      adjc[scc[i]].push_back(scc[adj[i][j]]);
51              }
52      }
53  };
```

4 Flow Network
